Water Storage Tanks

Water Storage Tanks are made of high quality corrugated, hot-dipped galvanized, punched and annular rolled steel wall sheets for superior strength and durability. Every tank is custom built, unique to the customer's needs and assembled at the project site. A concrete floor or foundation is used to stabilize tank position and prevent excess movement. Each tank is engineered to withstand the wind loads, snow and seismic forces in specific locations to ensure longevity of the tank, making it extremely adaptable to any climate, landscape type or building facility.

Tanks are used in municipal and commercial development and in a variety of industries, including surface and deep mining.

Typical Tank Applications for Mining:

Manufacturing • Washing and Cooling Facilities • Dust Control
Potable Water • Fire Protection • Retention and Detention

Tanks have been installed in several countries around the world

Tanks can be built on site in a timely manner at a fraction of the cost of conventional bolt-up or welded steel tanks, plus can be erected on difficult to access project sites

Sizes range from 6' to 200' in diameter
