

RESIDENTIAL

Water Storage Tanks

Water Storage Tanks are made of high quality corrugated, hot-dipped galvanized steel which is punched and annularly rolled into wall sheets for superior strength and durability. Every tank is custom manufactured, unique to the customer's needs and assembled at the project site. A concrete floor or foundation is used to stabilize the tank position and prevent excess movement. Each tank is engineered to withstand the wind loads, snow and seismic forces in specific locations to ensure longevity of the tank, making it extremely adaptable to any climate, landscape type or building facility.

Rainwater harvesting offers several advantages to new and existing homes, including tax breaks*, soft water, and free/unrestricted water. CorGal Tanks are a premium solution that will complement the aesthetics of your home.

*Check with your local building authority to determine if tax breaks or other incentives are available.

Typical Tank Applications:

Rainwater Harvesting for Irrigation • Potable Drinking Water • Toilet Flushing
Stormwater Management • Erosion Control • AC Condensate • Greywater Reuse

Tanks are proudly featured on homes across the country

Are you interested in energy efficiency and sustainable building practices?

Tanks can be built on difficult to access project sites
and customized to complement your architectural design.

Common residential tank sizes range from 700 to 30,000 gallons.
